Summary

Site name: Land at Lane End Farm, Cutbush Lane, Shinfield, Berkshire

Grid reference: SU 7343 6870

Site activity: Evaluation (Two Phases)

Date and duration of project: 13th–19th October 2004 and 17th–18th February 2005

Project manager: Steve Ford

Site supervisor: Jo Pine and Andy Taylor

Site code: LEFS03/109

Area of site: c.6 ha

Summary of results: No archaeological deposits were encountered

Monuments identified: None

Location and reference of archive: The archive is presently held at Thames Valley Archaeological Services, Reading and will be deposited at Reading Museum in due course, with accession code REDMG:2003.335

This report may be copied for bona fide research or planning purposes without the explicit permission of the copyright holder.
Introduction

This report documents the results of two phases of an archaeological field evaluation carried out at a former horticultural station and nursery of c. 6ha on the north side of Cutbush Lane, Shinfield (SU7343 6870). The work was commissioned by Mr Andrew Lehmann of David Wilson Homes Southern, Norgate House, 1 Tealgate, Charnham Park, Hungerford, Berkshire RG17 OYT.

Outline planning permission (O/2003/8525/6) has been granted by Wokingham District Council for the construction of 164 new dwellings following demolition of existing structures on the site. As a consequence of the possibility of archaeological deposits on the site which may be damaged or destroyed by groundworks, a field evaluation has been requested in accordance with *Archaeology and Planning* (PPG16, 1990) and the District’s policies on archaeology. The field investigation was carried out to a specification approved by Mr Kev Beachus of Babtie, then archaeological advisers to Wokingham District. The fieldwork was supervised by Jo Pine and undertaken with Sian Anthony and Tim Christian between the 13th and 19th of October 2004 and by Andy Taylor with Ceri Falys between the 17th and 22nd February 2005. The site code is LEFS03/109. The archive is presently held at Thames Valley Archaeological Services, Reading and will be deposited at Reading Museum in due course with the accession code REDMG:2003.335.

Location, topography and geology

The site is located on the north side of Cutbush Lane, Shinfield (SU7343 6870) and is c. 6ha in extent. It was formally a horticultural station and nursery containing large green houses, associated structures, access ways and scrubland. At the time of the first phase of fieldwork the site was in the process of being demolished by a contractor and several areas were inaccessible or occupied by live services. The site slopes from the north-east at c.67m above Ordnance Datum to c.58m at the south-west. The site is located on the border of London Clay and Plateau gravel (BGS 1946) both of which were encountered within the evaluation trenches with an outcrop of valley gravel close by.
**Archaeological background**

The site lies in an area relatively rich in archaeological deposits visible from the air (Gates 1975) and with further evidence gained from field survey (Ford 1997). A wide range of dates and site types are present within the area. To the south of the site, field evaluations uncovered elements of a probable Iron Age ditch (Saunders 2001; Taylor 2001). Iron Age and Roman boundary features and a cremation burial have recently been located further to the west on Hollow Lane (Taylor 2002).

**Objectives and methodology**

The aims of the evaluation were to determine the presence/absence, extent, condition, character, quality and date of any archaeological or palaeoenvironmental deposits within the area of development. This work was to be carried out in a manner which will not compromise the integrity of archaeological features or deposits which would warrant preservation *in situ*, or might better be excavated under conditions pertaining to full excavation.

The specific research aims of this project are:

a) To determine if archaeologically relevant levels have survived on this site.

b) To determine if archaeological deposits of any period are present.

The specification for both phases of the evaluation called for the excavation of 110 trenches each 1.8m wide and 30m long (10% of site area) in a stratified random configuration. In the event it was not possible to achieve this number due to severe logistic and access problems on the site. A reduced number of trenches was excavated and their lengths will vary according to access. This revised strategy was arrived at in consultation with Ms Fiona McDonald of Berkshire Archaeology, archaeological advisers to the District Council.

For the phase 1 evaluation the logistical problems included the presence of buried and overhead cables (live), large stands of trees which are to be retained, access routes which need to be retained, areas of Japanese Knotweed infestation, nesting bats and active badger sets. In the first phase of the evaluation, 57 trenches were excavated by the use of a 360° type machine fitted with a toothless ditching bucket. Fifty-six of the trenches were dug under constant archaeological supervision (Tr 1–56) and one (Tr 57) was excavated by the contractor whilst trying to locate a live service. Trenches 1–56 ranged in length between 10.2m and 66m and were 1.8m wide. Trench 56 was 0.70m wide and 42m long. Three grubbing holes (A–C) were also excavated by the contractors and these were also examined.

Phase two of the fieldwork comprised trenches 58–69 which were dug using a JCB type machine fitted with a toothless ditching bucket. Again logistical problems such as the presence of the construction site
compound as well as an area being used for the storage of concrete pipes meant some intended areas could not be trenched.

A complete list of trenches giving lengths, breadths, depths and a description of sections and geology is given in Appendix 1.

Results

Phase 1 Trenches

The trenches have been summarized according to stratigraphy.

Trenches 1, 2, 23–25, 33–36, 38–44, 48–56 (Plate 1)

These trenches showed topsoil onto a light grey brown sandy silt subsoil deposit onto light orange/yellow/light brown sand (with varying amounts of clay within its matrix) and varying amounts of gravel and clay patches. No archaeological features were observed in these trenches and many had been disturbed by field drains.

Trenches 9, 15–17 (Plate 2)

The stratigraphy in these trenches was demolition rubble onto light grey brown sandy silt subsoil onto light orange/yellow/light brown sand (with varying amounts of clay within its matrix) and varying amounts of gravel and clay patches. No archaeological features were observed in these trenches and trench 16 had been disturbed by modern postholes (glass filled) and live service trenches.

Trenches 3–4, 14, 22, 30 and 32

The stratigraphy in these trenches was demolition rubble directly onto light orange/yellow/light brown sand (with varying amounts of clay within its matrix) and varying amounts of gravel and clay patches. The lack of topsoil and subsoil suggests truncation of these areas. No archaeological features were observed and the trenches had been heavily disturbed by field drains and redundant water pipes.

Trenches 5–13, 18–21, 26–28, 31, 37, 45–47 (Plates 3, 4)

These trenches showed a very thin band of demolition rubble onto light brownish/orange clay. These trenches had been disturbed by modern services and modern features probably elements of the structures that once stood
in these areas. No topsoil or subsoil was observed in these trenches suggesting these areas had been truncated and topographically these areas were much lower than the surrounding land surface. It appears the building foundations had severely disturbed these areas and probably destroyed any archaeological deposits if they had existed.

**Contractors excavations**

Three holes (A, B and C) have been excavated by the contractor, when grubbing out various modern structures and tanks. The sections remaining were examined and in the case of (B) the base was examined; it was not possible in the other two due to water ingress. The stratigraphy in the sections was a thin band of demolition rubble 0.05–0.20m deep onto light orange clay. No archaeology was observed.

**Trench 57**

A trench was excavated by contractors to locate a modern service. This was approximately 42m long, 0.70m wide and 0.50m to 1.00m deep. The stratigraphy was made ground/demolition rubble (0.50–0.70m deep) onto orange clay at the southern end and sand and gravel at northern end. This trench had been disturbed by modern services and no archaeological deposits were observed.

**Phase 2 Trenches**

All trenches measured 1.60m wide and consisted of topsoil overlying subsoil overlying gravel natural.

**Trench 58**

This trench consisted of topsoil overlying subsoil gravel natural. A ditch was identified between 5.50m and 8.20m. Aligned approximately east–west this was investigated and found to contain fragments of post-medieval brick and tile (not retained). Two gullies were also noted in this trench between 10.50m and 11.00m and 18.00m and 18.90m. Upon investigation both were found to contain pieces of clinker and modern brick.

**Trench 65**

This trench consisted of topsoil overlying subsoil overlying gravel natural. At the western end of the trench a possible feature was identified. This was found to contain pieces of clinker as well as large pieces of wood and root remains. This most likely represents a former treebole or grubbed out hedge.
Trench 69

This was an area of 30m x 25m that had been stripped by the groundworks contractor without archaeological supervision before the second phase of trenching had begun. However, it had been stripped with a toothless bucket to expose the archaeologically relevant levels. It was examined shortly after it had been striped and was therefore in a fresh condition. No deposits nor finds of archaeological interest were observed. A modern ditch observed in trench 58 to the north west was also visible in this area.

Finds

No archaeological finds were recovered during the evaluation. Modern 19th- and 20th-century finds such as glass, brick and tile, metalwork and flowerpots were noted in features but not retained.

Conclusion

No archaeological deposits were recorded during either phase of the fieldwork and no finds were recovered. Large areas of the site had been badly truncated, probably during construction of the horticultural station and nursery; indeed some of the greenhouse bases had been terraced into the hillside. This truncation will have destroyed any archaeological deposits if they had once existed in these areas. Small tracts of land to the south west, north and a larger area to south-east had not been disturbed by the previous structures. However, even in these areas no archaeological deposits were encountered. On the basis of the results of the field evaluation the areas of site which have been trenches have little or no archaeological potential.
